

Proposed Solution Template

Date	25 September 2026
Team ID	6ab22227a614981d6d2c6451
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	2 Marks

Proposed Solution Details:

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Manual employee data imports from spreadsheets into the system often cause duplicate records (data corruption) and lack centralized, real-time visibility for HR management.
2.	Idea / Solution description	An automated data ingestion pipeline using ServiceNow Import Sets and Transform Maps. It utilizes the "Coalesce" feature on the Employee ID field to automatically identify and update existing records, preventing duplicates. The clean data is then visualized via centralized Dashboards.
3.	Novelty / Uniqueness	Intelligent record matching (Coalesce) ensures zero duplicate entries without requiring complex backend SQL scripts. It seamlessly turns static offline Excel data into dynamic, interactive online dashboards in a few clicks.
4.	Social Impact / Customer Satisfaction	Greatly reduces the administrative burden and stress on HR/Admin teams, completely prevents data corruption, and improves management's ability to make quick, data-driven decisions based on accurate headcount reports.
5.	Business Model (Revenue Model)	Internal Operational Tooling (Cost-Saving Model). The solution significantly reduces operational hours spent on manual data entry and minimizes IT support tickets related to data correction.
6.	Scalability of the Solution	Built on the highly scalable ServiceNow cloud platform, the Import Set architecture is capable of handling millions of records and scaling effortlessly as the organization's workforce grows globally.
